Mobile App Launch - Weekly Downloads & Crash Rate

A new app's first 10 weeks post-launch. The app was featured by the App Store in Week 5. A stability hotfix shipped at the end of Week 7.

Week	Downloads	Crash Rate (%)
1	2000	1.2
2	5500	1.4
3	9000	1.3
4	15000	1.5
5	40000	4.8
6	22000	4.5
7	18000	2
8	16000	0.9
9	15000	0.7
10	14500	0.6

Context: the App Store feature in Week 5 was unplanned and unannounced to the team in advance.

Narrative Moments and Final Storyline

What are Narrative Moments?

Narrative moments are the important events or changes in a dataset that help us turn numbers into a meaningful story. Instead of just looking at the data, we identify **what changed, what caused a problem, what was unexpected, and how the situation was resolved.**

For this dataset, the main narrative moments are:

1. Change – Steady Growth

During **Weeks 1–4**, downloads increased from **2,000 to 15,000**. The crash rate remained low, between **1.2% and 1.5%**.

This shows that the app was gaining popularity while remaining relatively stable.

2. Surprise – Unexpected App Store Feature

In **Week 5**, something unexpected happened. The app was featured by the App Store without advance notice.

Downloads suddenly increased from **15,000 to 40,000**. This was a major and unexpected change.

3. Conflict – Growth vs. Stability

The sudden increase in users caused a problem. The crash rate increased sharply from **1.5% to 4.8%**.

Downloads also dropped to **22,000 in Week 6**, while the crash rate remained high at **4.5%**.

The main conflict was:

The app was becoming more popular, but its stability could not handle the sudden increase in users.

4. Turning Point – Stability Hotfix

At the end of **Week 7**, the team released a stability hotfix.

After the hotfix, the crash rate started falling:

- Week 7: **2.0%**
- Week 8: **0.9%**
- Week 9: **0.7%**
- Week 10: **0.6%**

This was the turning point because the situation changed from **crisis to recovery**.

5. Resolution – App Becomes Stable

By **Weeks 8–10**, the crash rate continued to decrease and reached only **0.6%** in Week 10.

Downloads stabilized around **14,500–16,000 per week**. The app was no longer experiencing the severe crash problem caused by the sudden growth.

Storyline:

Mobile App Launch – From Rapid Growth to Stability

The app started its first four weeks with steady growth. Downloads increased from 2,000 in Week 1 to 15,000 in Week 4, while the crash rate remained low and stable between 1.2% and 1.5%.

The major surprise came in Week 5 when the app was unexpectedly featured by the App Store. This caused downloads to suddenly rise to 40,000. However, the sudden increase in users created a stability problem, and the crash rate increased sharply to 4.8%.

This created a conflict between rapid growth and app stability. In Week 6, downloads fell to 22,000, but the crash rate remained high at 4.5%. The team needed to improve the app's stability before it could continue growing successfully.

The turning point came at the end of Week 7 when the team released a stability hotfix. After the fix, the crash rate dropped from 2.0% in Week 7 to 0.9% in Week 8 and continued falling to 0.6% by Week 10.

By the end of Week 10, the app had recovered from the crash crisis. Downloads had stabilized around 14,500–16,000 per week, while the crash rate reached its lowest level. Overall, the story shows how unexpected popularity created a stability crisis, but the team's quick response helped the app recover and become stable again.

Storyline in Short

Steady growth → Unexpected App Store feature → Sudden download surge → Crash-rate crisis → Stability hotfix → Recovery and stabilization.
